1. About package foo in R

The special JSS style commands related to software and mathematical formulas are written as follows in LYX: R or R for the names of programming languages, **foo** or **foo** for software packages, and `some code` or **some code** for code; E for expectations, VAR for variances, COV for covariances, and P for probabilities.

Writing several lines of code:

```
first line of code
second line of code
third line of code
```

Alternatively, you can distinguish between input and output code:

```
first line of input code
second line of input code
```

```
first line of output code
```

```
second line of output code
third line of output code
```

Acknowledgments

Here you can write some acknowledgments.
